XCarrier
API & System Interfaces

XCarrier provides a broad, open API/interface portfolio so source and target systems, as well as connected data streams, can be easily and securely integrated and exchanged. XCarrier thus becomes the central enterprise storage system.

The following formats and data exchange mechanisms are available:

- Generic/native file formats such as .xlsx (Excel) or .csv (generic table format)
- Generic SOAP/XML and feature-rich REST/JSON interfaces
- Generic ftp/sftp, http/https data collection protocols
- Generic LDAP integration including group security checks
- Proprietary, binary data exchange formats from various manufacturers (e.g. voice/IMS switches). Large binary objects contain unlimited field sizes that are supported by XCarrier.

Other file formats or data protocols can be integrated quickly
