

XCarrier Monitoring

XCarrier Monitoring includes all levels and modules of the XCarrier Platform.

Hardware monitoring of performance and use of CPU, memory and disk space form the foundation of a properly functioning system setup.

Active database monitoring supports XCarrier users with regard to available space, performance, integrity and quality. Database consistency, growth, tables, integrity, completeness and other performance parameters are measured and monitored.

The watchdog proactively monitors the system and registers all occurring events and logins by people or systems.

Application-specific monitoring, such as file checks, processing checks, etc., round off the comprehensive XCarrier Monitoring functionalities.

With XApps, small monitor screens are arranged to display system logs, job statuses or watchdog information in a variable manner.
